

stratustime®

We speak your clients' language

The stratustime Web Services API makes it easy for clients to customize and connect from any system.

Our time & attendance system was thoughtfully designed to work with a wide range of client systems — creating a **seamless interface for the end-user**.

For our white label partners, the **system can be customized to fit within a client's identity** so employees feel like they're still on their company platform.

What is the stratustime Web Services API?

The magic under the hood is the stratustime Web Services (STWS) API – allowing external systems to connect seamlessly with the stratustime SaaS engine.

Our API offers multiple methods for interacting with data contained in the **stratustime** system and is designed for end users to view and send data via XML, JSON, or SOAP.

How it works

Users can use any language to interact with the STWS API, as long as the languages use **JSON, XML, or SOAP** as the standard for sending and receiving the data. You can **manipulate employee data, add punches, export time**, and much more.

Make it personal

For white label marketing partners, it can be **customized to appear seamlessly as part of a client's internal system** — coordinating perfectly with an employee's single sign-on.

Real-Time Data

Have clients who need to be able to access real-time data? The **API allows clients to log in and import information into a database of their choice, where it updates in real time.**

Ready to learn more?

Our team is ready to answer any questions you have and get you started on a profitable new partnership with us.

Please contact us at **(800) 561-6366** or simply **complete our partnership request form at nettimesolutions.com/clients/partners.**

We look forward to working with you!

stratustime is a full-featured cloud-based time & attendance system, providing businesses of any size with a secure, user-friendly solution to track employee hours, create schedules, send messages, and create analytics.
